

KNighter or other
LLM generator

(a) LLM Generator
context

Draft
checker/query

Patch

Source tree

Validation target

(b) Evidence assembly (typed)

Patch preflight

- Patch facts
- Rule-guided requirements

Source extraction

semantic_slice: function, guards,
calls, mem/state, build flags

Analyzer context

- CSA: CFG / call graph
- Optional checker-execution observations
- CodeQL E2: source-derived context

Validation feedback

validation_outcome:
failure_mode, repair

Extensible Refinement Layer for LLM-Based Checker Generation

Merge · deduplicate · retain missingness

(c) EvidenceBundle

Typed records and bounded
views

- Origin:
internal / output / source-
derived
- Scope · location · semantic
payload
- Interface · raw-output hash
- Missing evidence stays explicit

(e) Audit artifacts

- evidence bundle
- analyzer results
- final report
- all attempts and
retained checker

Retained D*

(d) Refinement plugin
(paired-warning refinement)

Refinement agent
Edit latest attempt L

Candidate checker/query

Paired validation

Retain a valid, changed
candidate if:

- vulnerable-side warnings
recover; or
- fixed-side reports decrease
with vulnerable-side warnings
retained.
